

## Passive Safety

### Crash Safety Body

- 03' model uses the same ladder- shaped frame that is used on the 02' model. In addition, the crossmembers have been optimally allocated to ensure an even higher level of crash safety.
- The side rail tips are made into axial-compression type collapsible zones to ensure excellent energy-absorption characteristics.

### Head Impact Protection Structure

- The front pillar garnish, center pillar garnish, roof side inner garnish, and roof side rail are adopted to absorb impact for head protection.
- These measures to lessen the impact to the occupant's head have been taken because of the possible secondary collision that could occur between the occupant and these parts of the cabin in the event of an accident.

### **SRS Airbag System**

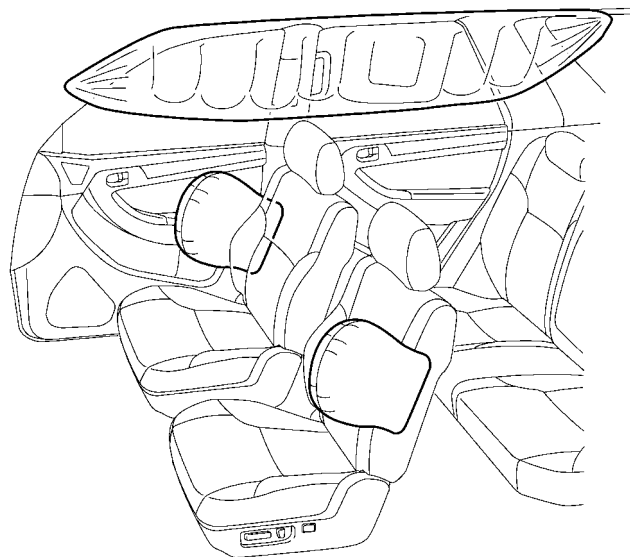

- SRS (Supplemental Restraint System) airbags for the driver and front passenger seats are standard in all models. In the event of a severe frontal collision, the airbags function with the seat belts to help reduce the impact on the driver's and front passenger's head and chest.
- SRS curtain shield airbag (Front/Rear seats) and SRS side air bag (Driver/Front passenger seats), which help reduce side impacts, are optional on all models.
- Dual-stage SRS airbags system that optimally controls the airbag inflating output by judging the extent of impact etc, has been adopted for the driver and front passenger airbags.

## Seat Belt

Seat belts for the front seats are equipped with pretensioners, which are helpful to restrain the occupants in a severe frontal collision, and force limiter, which softens the impact to the chest from the seat belt itself.
